

Here a few of my comments about “broadband internet over power line service (BPL)”.

1. First there are other more elegant (and shielded) ways to distribute broadband signals to the end users, like Cable TV, or better yet, lets get moving on a nation wide “Fiber to the home system”. Which would be much faster and impervious to external interference problems, as well as it interfering with other radio transmissions.

2. The use of an un-shielded system like BPL will pollute the entire radio spectrum. Which will negatively impact every radio user. Especially those systems that use weak signal technology.

Please, DO NOT allow the use of BPL within the USA.

Thank you for your time.  
John Wilson
